

# Agile Requirements with ATSC

## Highlights

- **The Business Challenge:** The return on investment makes a compelling argument but what is different about an agile requirements approach?
- **The Solution:** We will ensure your team understands the basic tenets of an agile requirements approach and real-world techniques they can apply immediately.
- **The Business Benefit:** Better knowledge and tangible experience of agile requirements techniques will position your team to eliminate waste, reduce time to market and improve quality.

## The ATSC Approach

Process improvement is not so much an engineering challenge as a people challenge. There will be resistance to change and other impediments to success that need to be uncovered, understood and addressed.

At ATSC we have been helping our customers implement iterative and incremental processes for many years. We understand the trade-offs and realities of process improvement, and our approach is pragmatic not dogmatic.

We also firm believe in the value of tools to facilitate collaboration and communication across a project team whether co-located or distributed.

## Agile Requirements

Our Agile Requirements class is highly-interactive and blends lecture with group exercises designed to promote participation and team-building.

We will cover topics such as:

- ▶ Writing effective User Stories
- ▶ The role of the Product Owner
- ▶ The Product Backlog
- ▶ Estimating the backlog
- ▶ Prioritizing the backlog
- ▶ Agility and use-case modeling
- ▶ Tools for your agile requirements team

*"As someone who learns well from doing instead of listening to a lecture and regurgitating information, I found the hands on exercises brilliant. This is exactly how it's done in the real world.", Bill Alexander. Business Analyst*
